Regression)

Process

Translate data, EDA, Sentiment Analysis,
Topic categorization and ML model to
predict Sentiment

Visualization

Visualize by topic the customers
feedback to gain business insight in
tableau

Findings

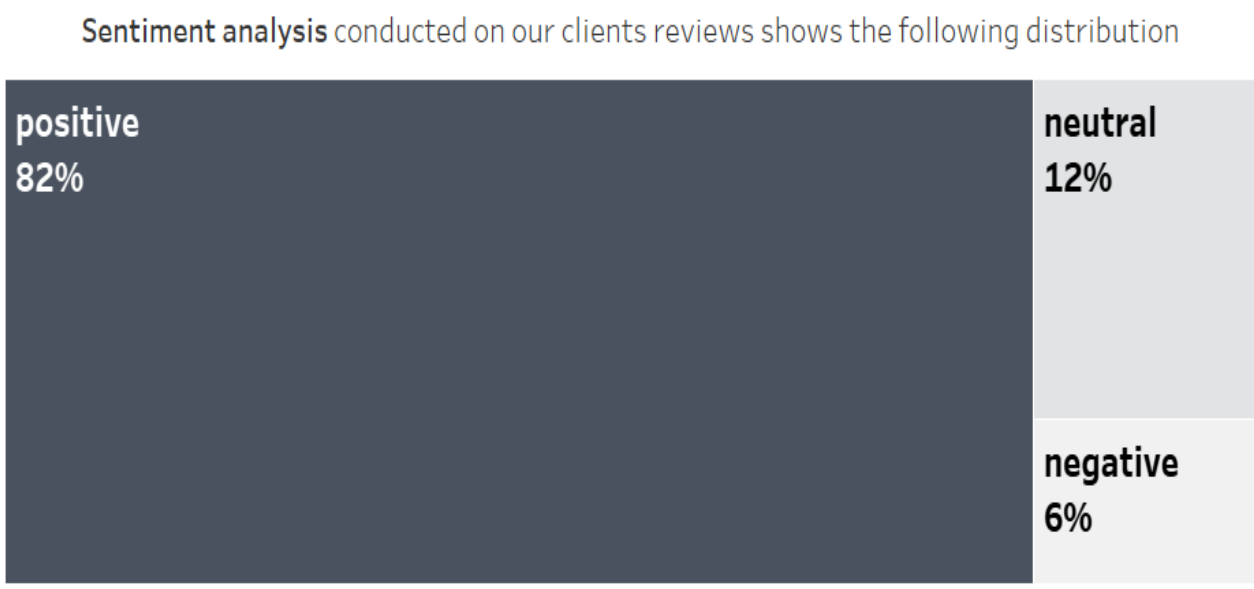

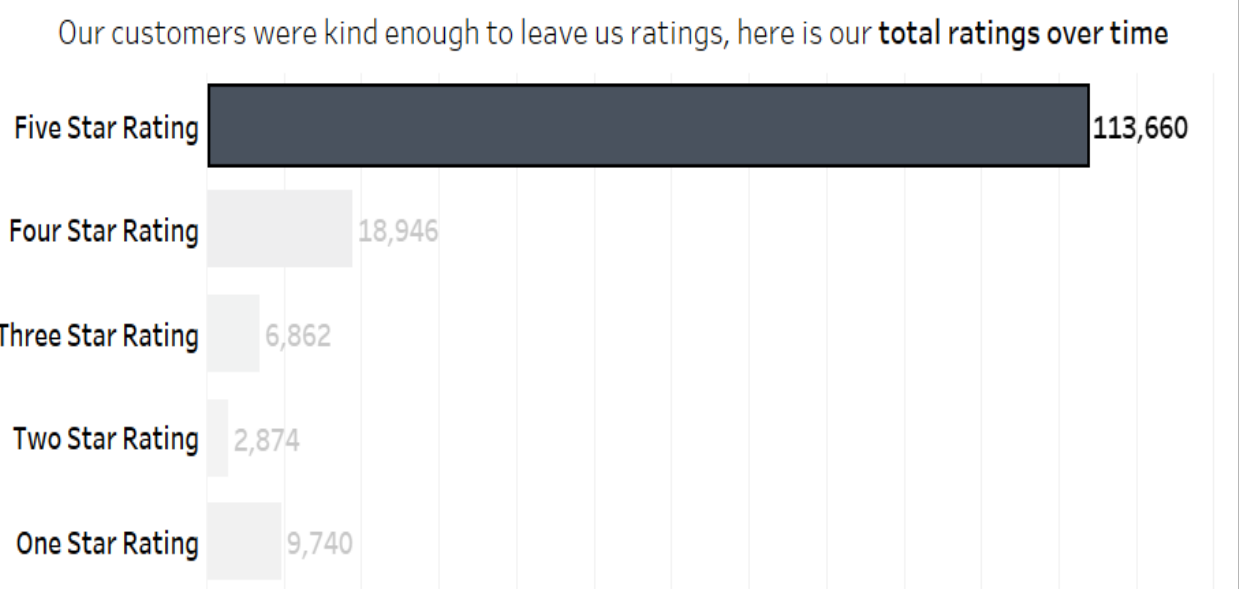

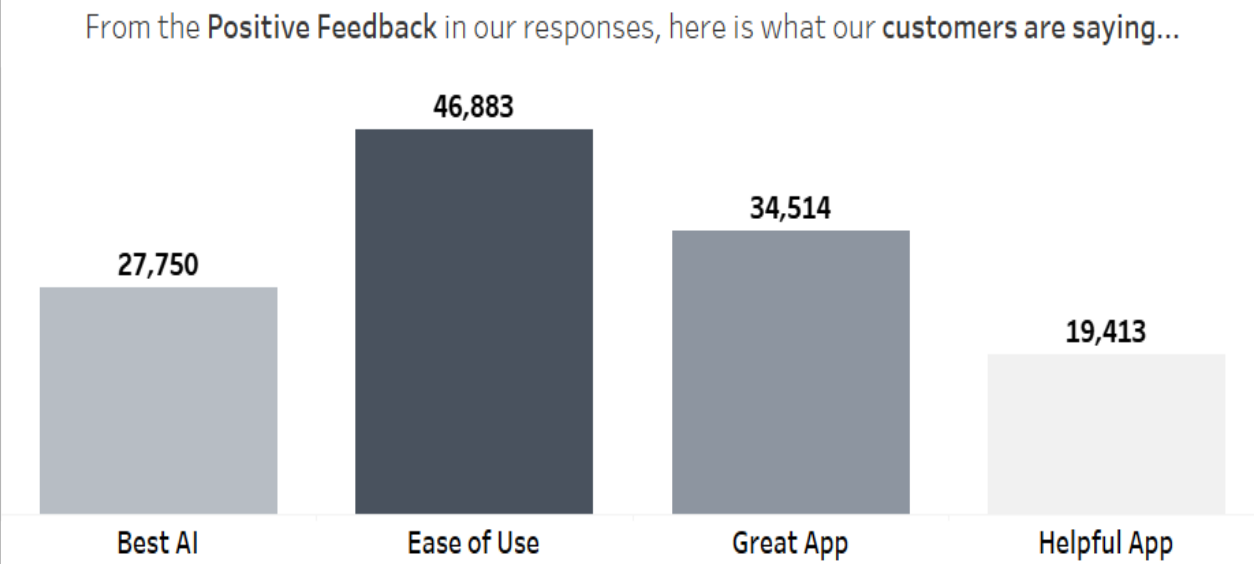

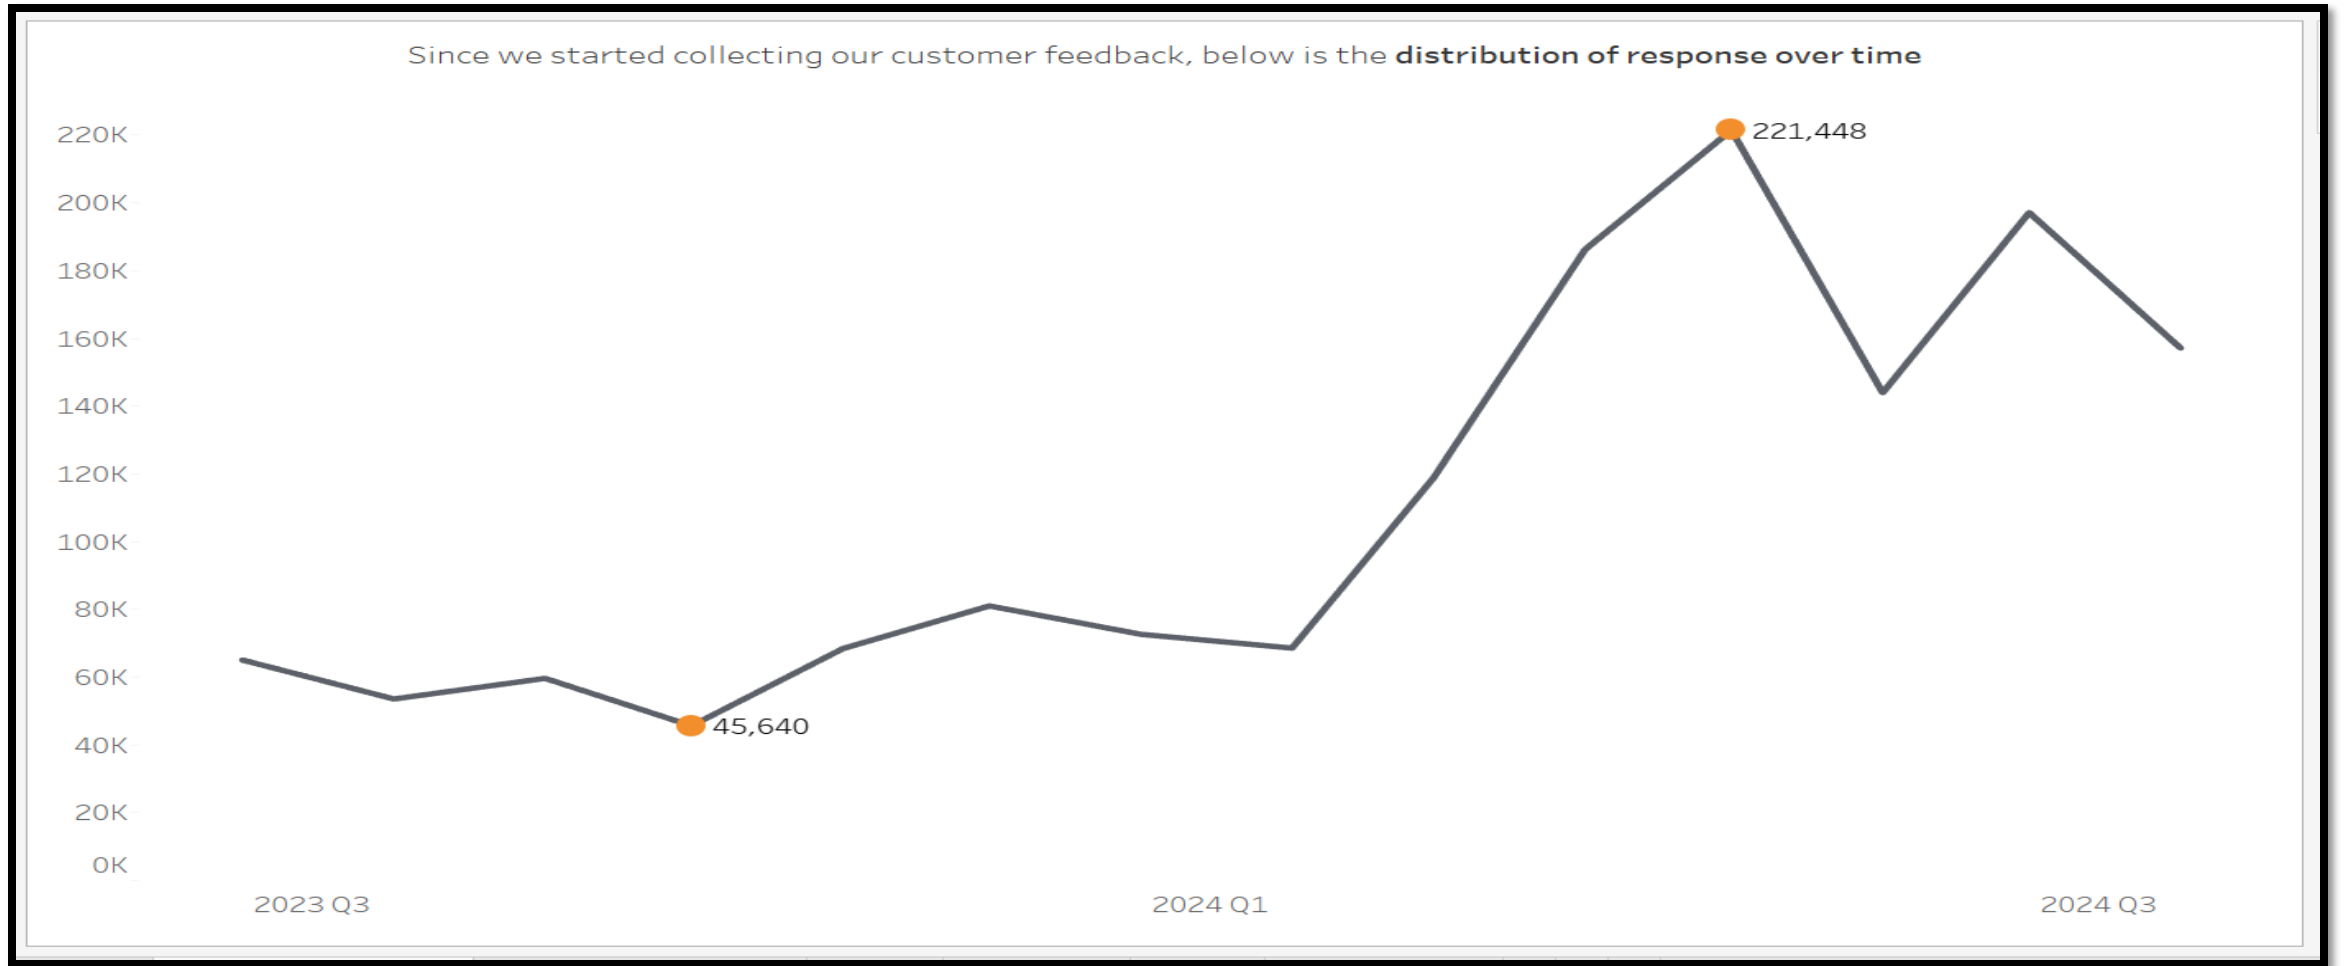

AI Customer Feedback

What are our customer saying?

Select Feedback type

Positive Feedback

Trend of our customer feedback from 2023-2024 with highest response on Q2 2024 after GPT4o Launched

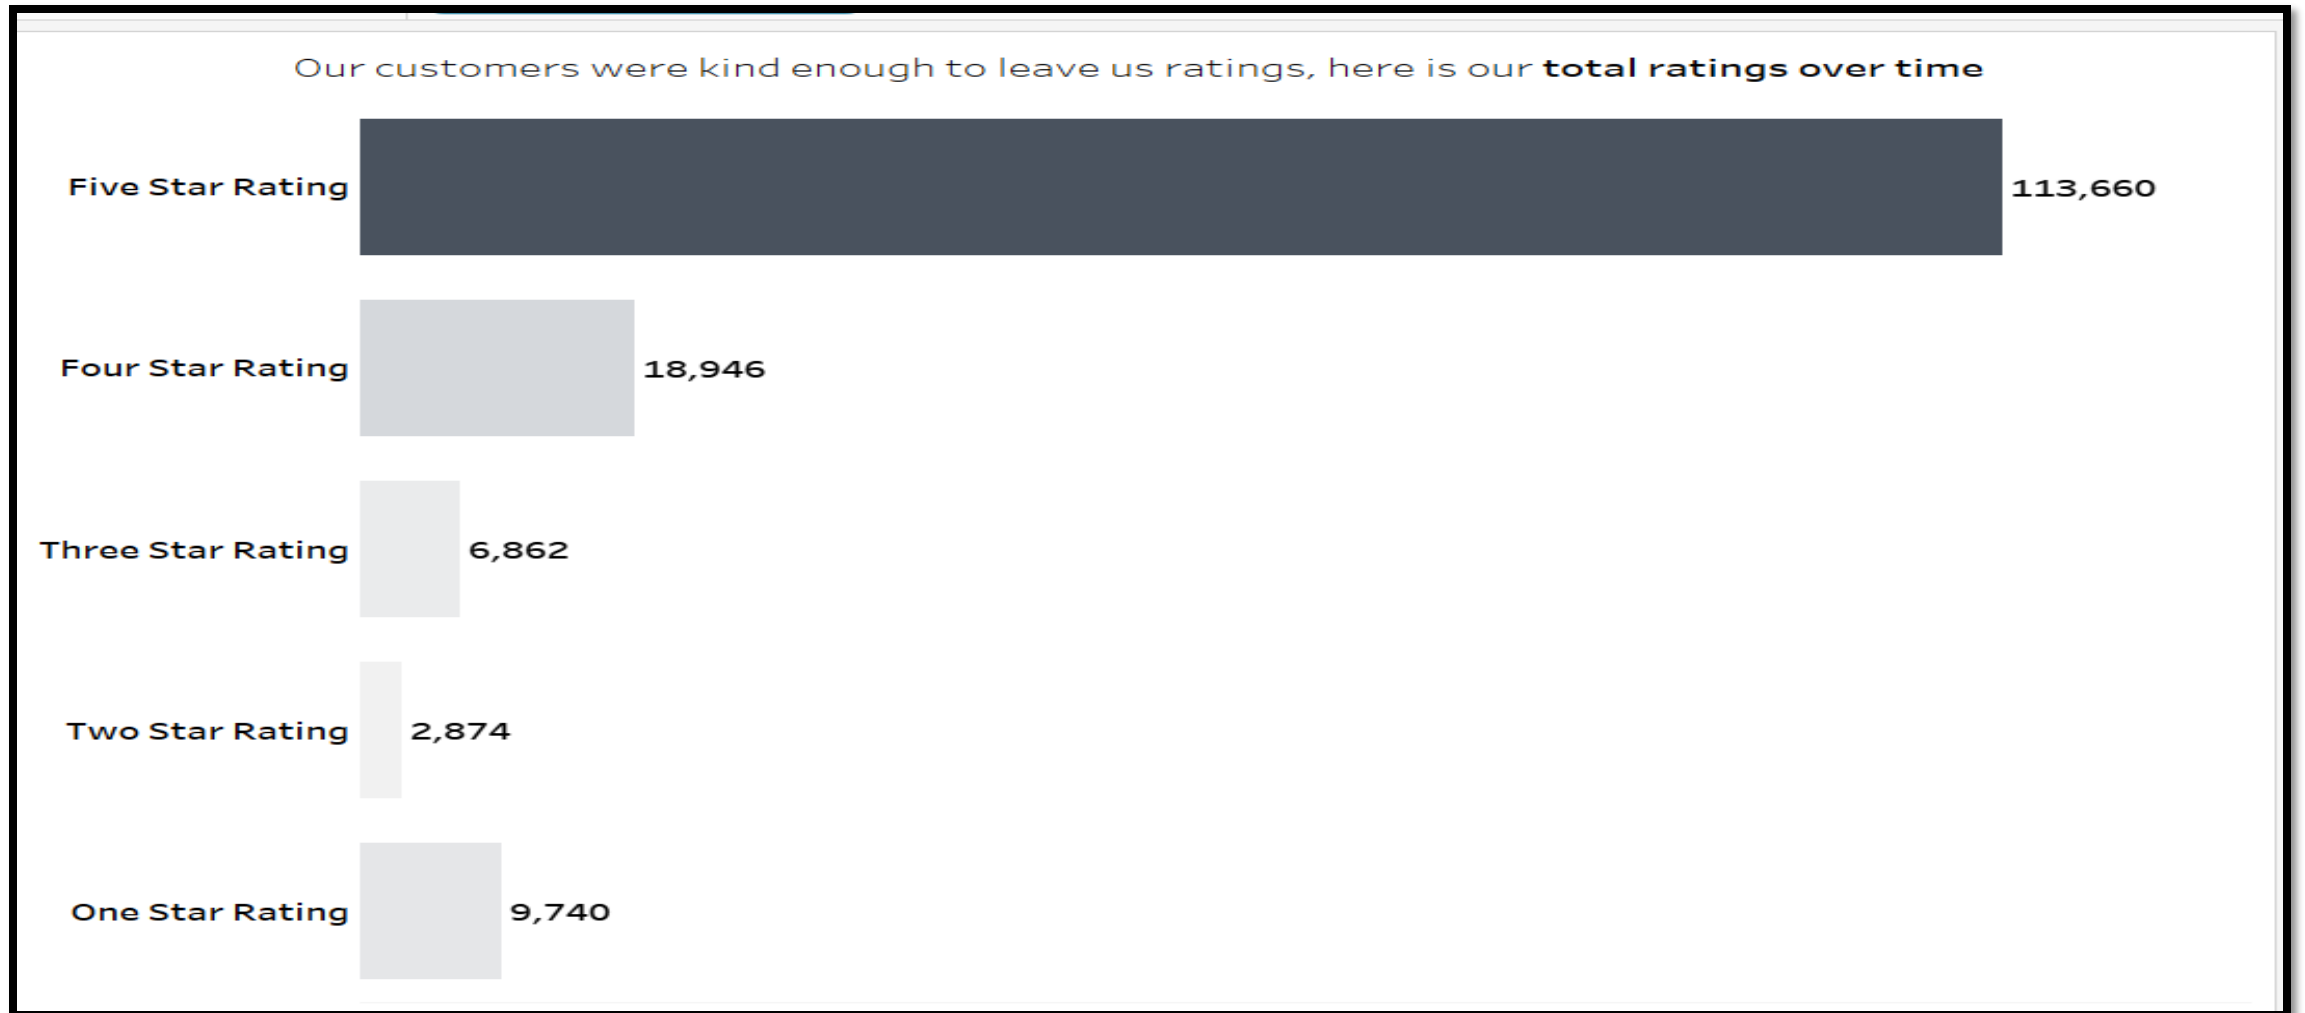

From the positive responses, our customers appreciate the ease of use, think of it as great app and really helpful best Ai there is.

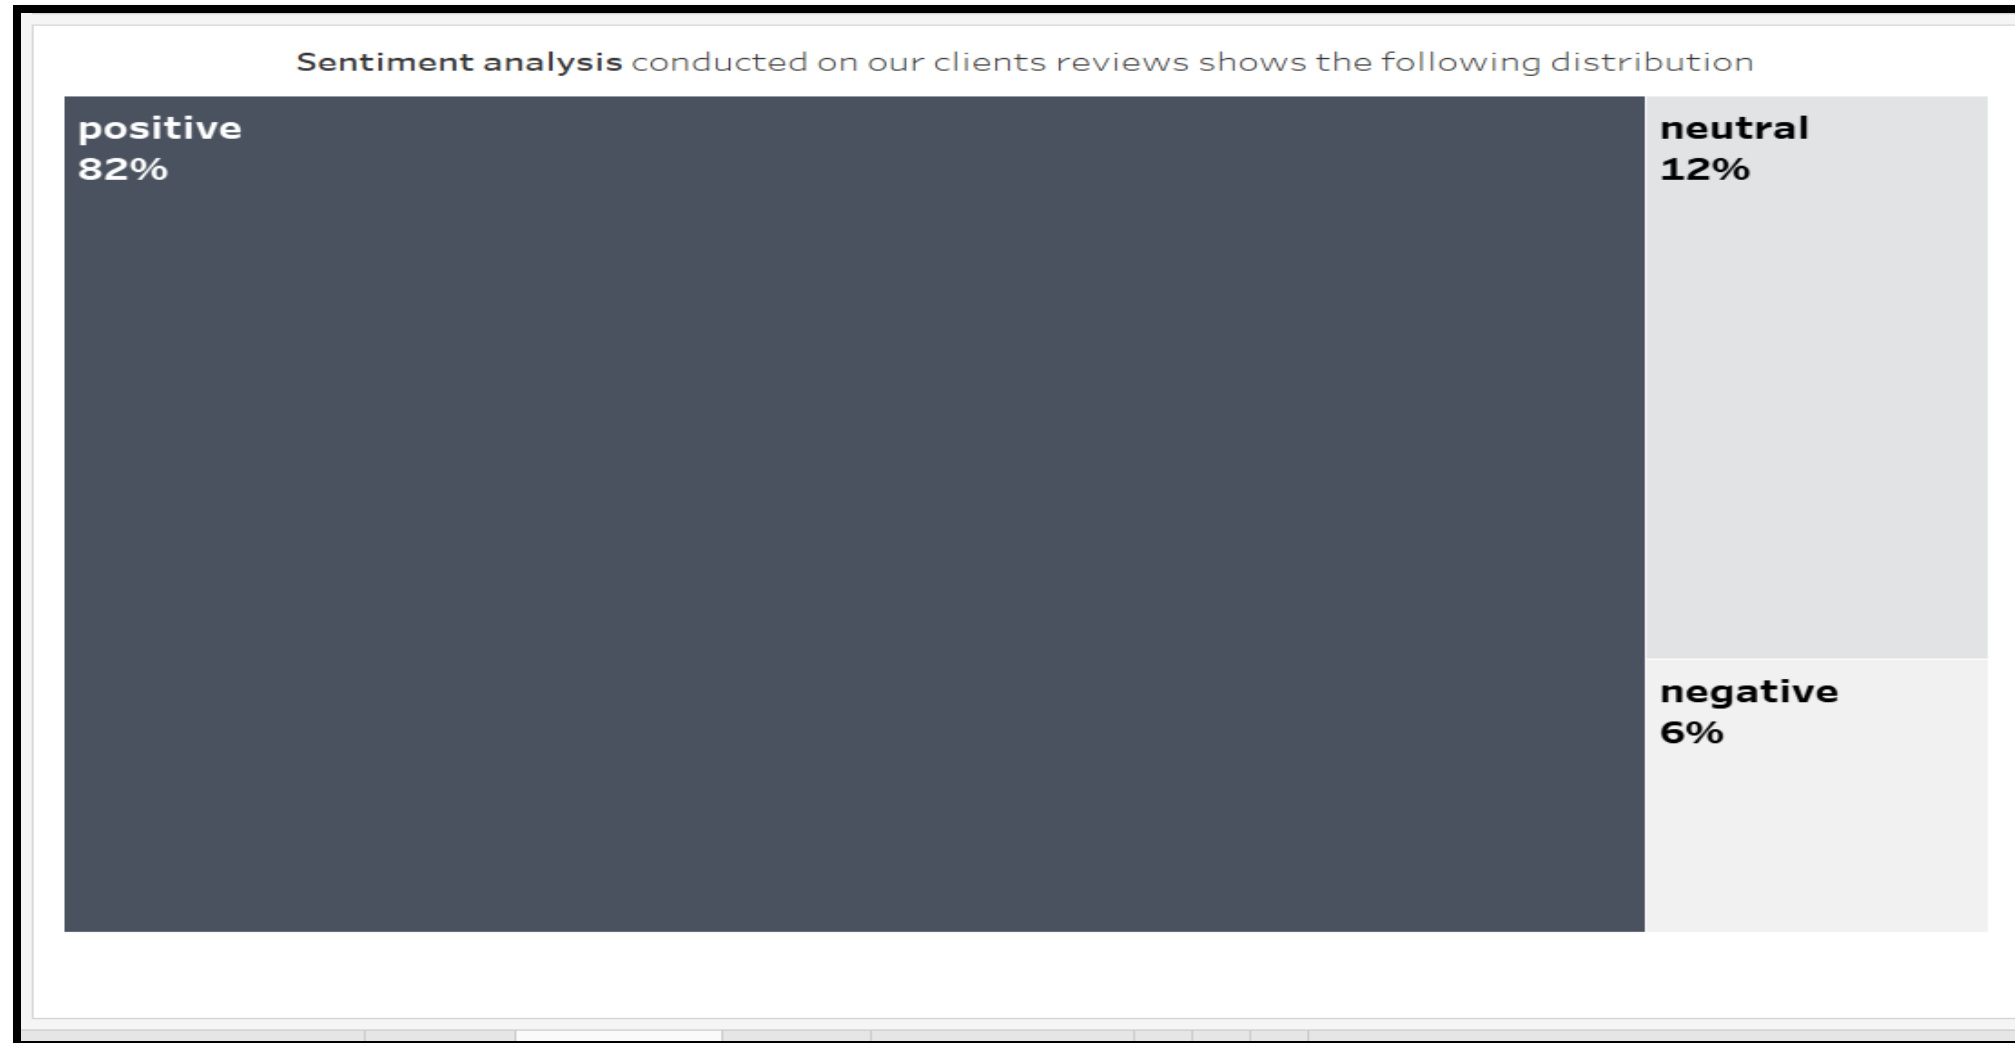

However our users are also struggling with usability especially after new update on May and have troubles with wrong output. Technical issue such as network error has been experienced and reported as well.

Majority of our customers rate our service and product as 5Star. We still have users who have issue with the product, further investigation of the complaints could help resolve their concerns

From all the reviews received by the customers, Over 80% are positive which is speaks highly of the service we provide. Sentiment analysis model also available to categorize and predict our customer sentiment.

Summary

Currently, our customer feedback is quite positive and majority if not all appreciate the product. However, some issues highlighted by our clients can also be addressed or investigated to ensure no repetitive problem escalating or recurring.

Further modification of our sentiment analysis machine learning model would help improve efficiency in identifying customers concern and ensure fast actionable decision making

Thank you
